

# Carbapenem-Resistant *Pseudomonas aeruginosa*

Organisms that carry a genetic element for [carbapenem resistance](#) also have resistance to multiple other antibiotic classes including Penicillins, Cephalosporins, Carbapenems, Fluoroquinolones, and Aminoglycosides.

There are only a few antibiotics that can treat infections of gram-negative organisms that have acquired a Carbapenemase-resistance, and resistance to those antibiotics can also develop.

The genetic element providing Carbapenem-resistance is mobile. It can **jump from one bacteria to another** and has been documented doing so in several case studies of hospital outbreaks. If we ever encounter a gram negative organism that is resistant to Carbapenem antibiotics we will likely want to consider further susceptibility testing.
